UNESCOSOST IN NUMBERS

THE UNESCO CHAIR ON SUSTAINABILITY (UNESCOSOST)

ESTABLISHED AT THE POLYTECHNICAL UNIVERSITY OF CATALONIA IN

1996

Is an organization dedicated to articulate and facilitate a multi-networking collaboration between different institutions in Europe and Latin America and the Caribbean, focused on knowledge and best practices transfer in sustainable human development, from local scale to the global level.

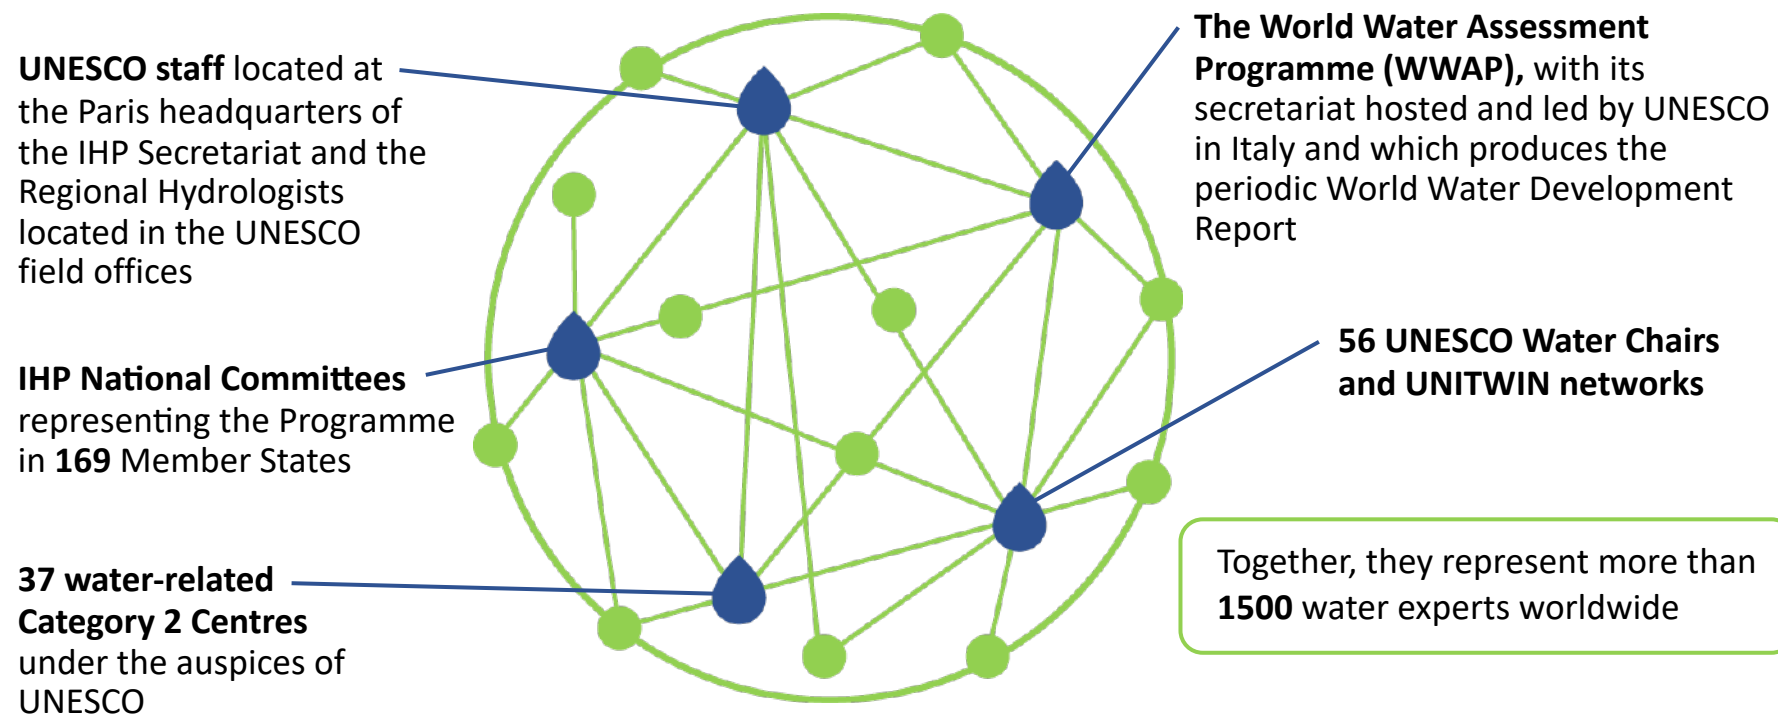

The work carried out over the last

20 YEARS

has contributed to turn UNESCOSOST into a model and a pole of innovation and excellence in matters related to the sustainable human development, especially in sustainable water resources management in innovative technologies to meet social, environmental and economic needs, and in the design and articulation of transformation participative projects oriented to SDG.

The UNESCO Water Family

Since the inception of IHD, UNESCO has been developing a network of networks, often called the UNESCO Water Family. Today, as IHP is working on its eighth phase (IHP-VIII), the UNESCO Water Family operates globally as a network which includes:

A WORLD IN CLIMATE HEALTH EMERGENCY

Future of the human climate niche

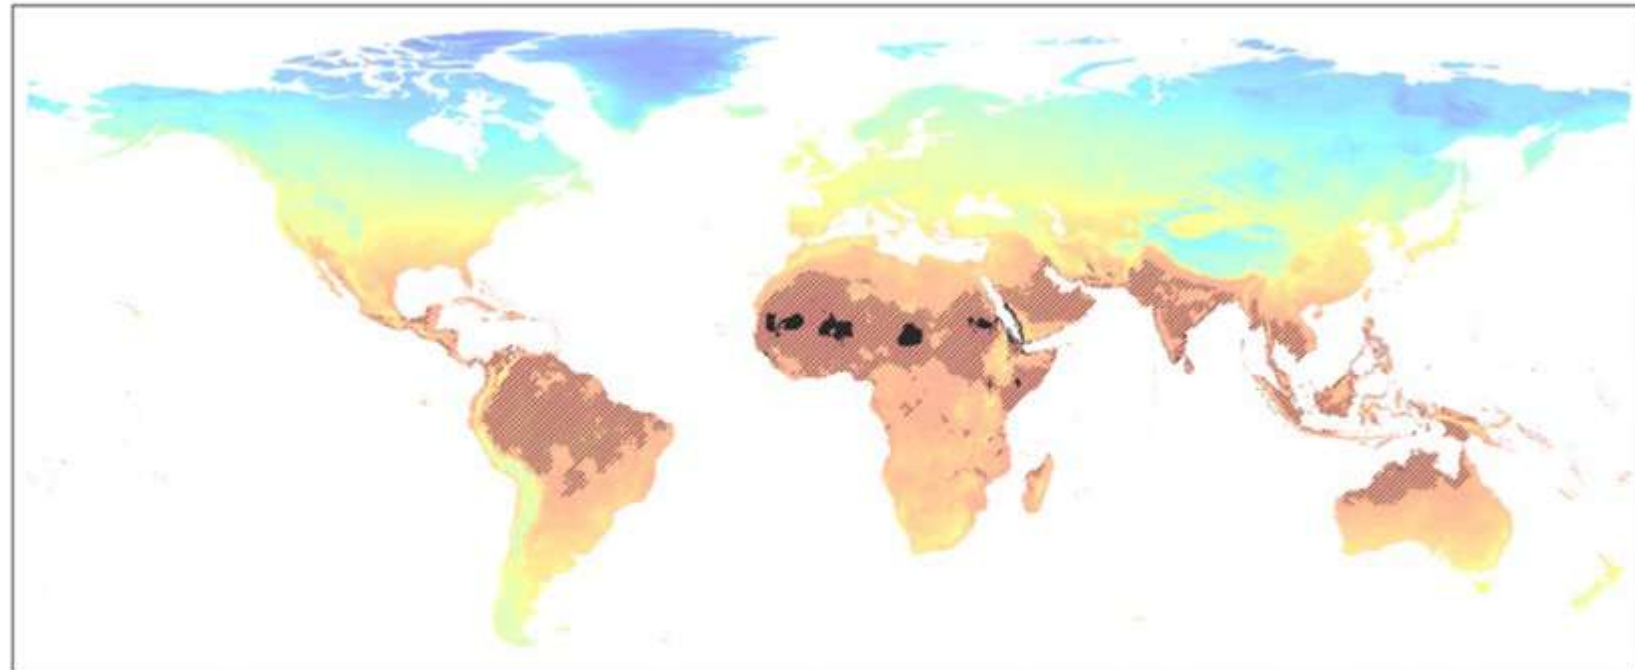

Chi Xu (徐驰)^{a,1}, Timothy A. Kohler^{b,c,d,e}, Timothy M. Lenton^f, Jens-Christian Svenning^g, and Marten Scheffer^{c,h,i,1}

LEARNING FROM THE PAST

Knowledge of the specific socio-cultural and technical system of an area is essential to understand how a **local population has coexisted with extreme events** in the past, **managing their adaptation to the environment.**

Community experience in the face of different threats and its capacity to confront, recover and adapt.

“Camellones”

Ancestral Hydrotechnologies: Hydraulic Zenú System

Rainy Season

Seeds and crops are protected from being washed away

Turning excess water to advantage (400 bC)

Water and sediments are a source of irrigation and nutrients.

Dry Season

Large expanses of land under water for several months, no crops left.

Problems in both seasons, flooding in winter, drought in dry season (Today)

Floodwater drains nutrients, leaving a sandy soil in which is hard to grow crops

Nexus **Water** - **Energy** – **Food** - **Ecosystems**

NATURE BASED SOLUTIONS

NATURE BASED SOLUTIONS

Good for biodiversity

Deployment of urban green infrastructure increases habitat for nature.

Good for disaster risk reduction

Coral reefs dissipate more than 97% of wave energy.

(Nature communication, 2014)

Good for our health

Health benefits from NBS include

- reduced depression,
- mental health improvement,
- reduced cardiovascular morbidity,
- improved pregnancy outcomes,
- obesity and diabetes reduction.

(ECLIPSE, 2017)

Important for jobs and business

Over 56,000 jobs created through the Emscher Landscape Park in North Rhine Westphalia region in Germany.

(WWF IJL Report: Nature Parks, 2020)

Vital for the climate

37% of climate mitigation needed until 2030 to keep global warming below 2°C.

(IPBES GA SPM key message 06, 2019)

URBAN GREEN SPACES – GREEN CITIES

Naturation & Naturalization as a Green Urban Governance tools

Naturation is a process based in the implementation of strategies and actions on urban Green, adding more vegetation and more Green spaces with ecological criteria, and with the purpose to achieve a “**Naturalization**” of the Urban System, or to favor the autochthonous wildlife and flora (Briz, 1999 y 2004) that could not be dangerous.

A good naturated urban system could be a biodiversity reservoir, comparable to a natural reserve area (Boada i Gómez, 2008).

Naturalization

Initial biodiversity

Urban biodiversity

Naturation (Trophotope Genotope)

NATURATION

Efforts to provide urban ecosystems with sustainable green spaces

NATURALIZATION

Process of biodiversity entry that is carried out on the basis of naturation.

BIODIVERSITY, one of the best ecosystem quality indicators

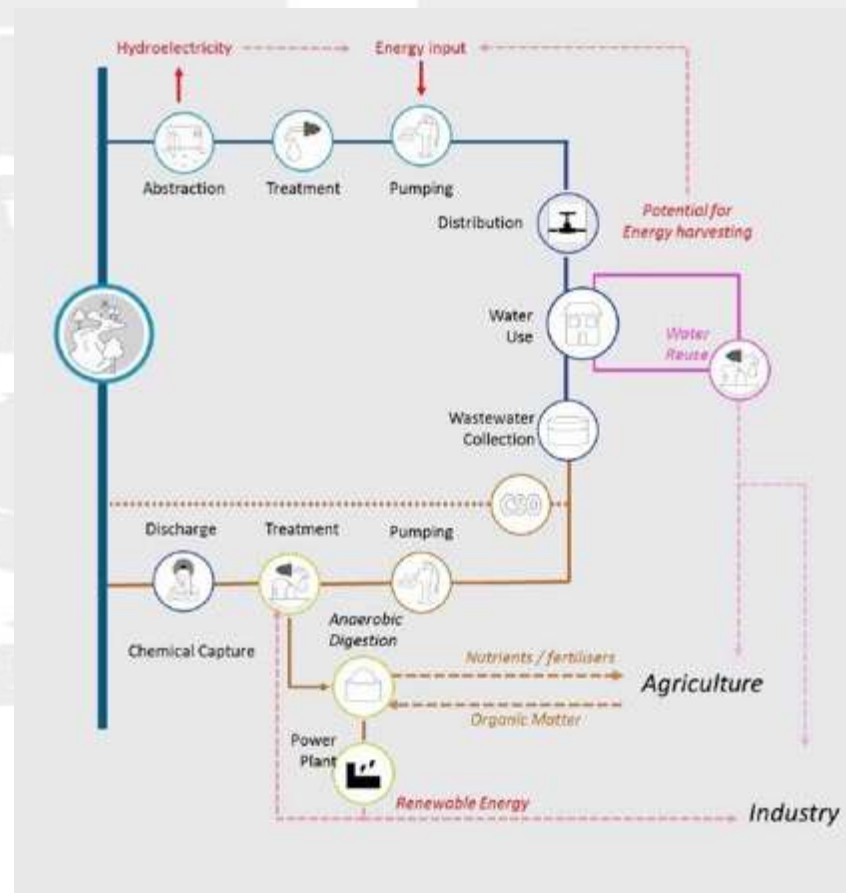

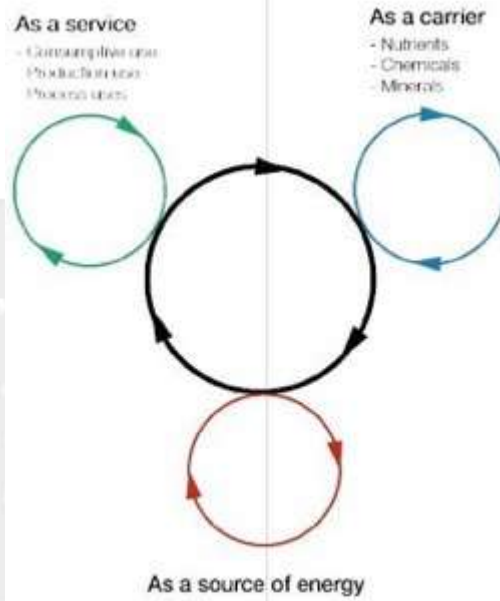

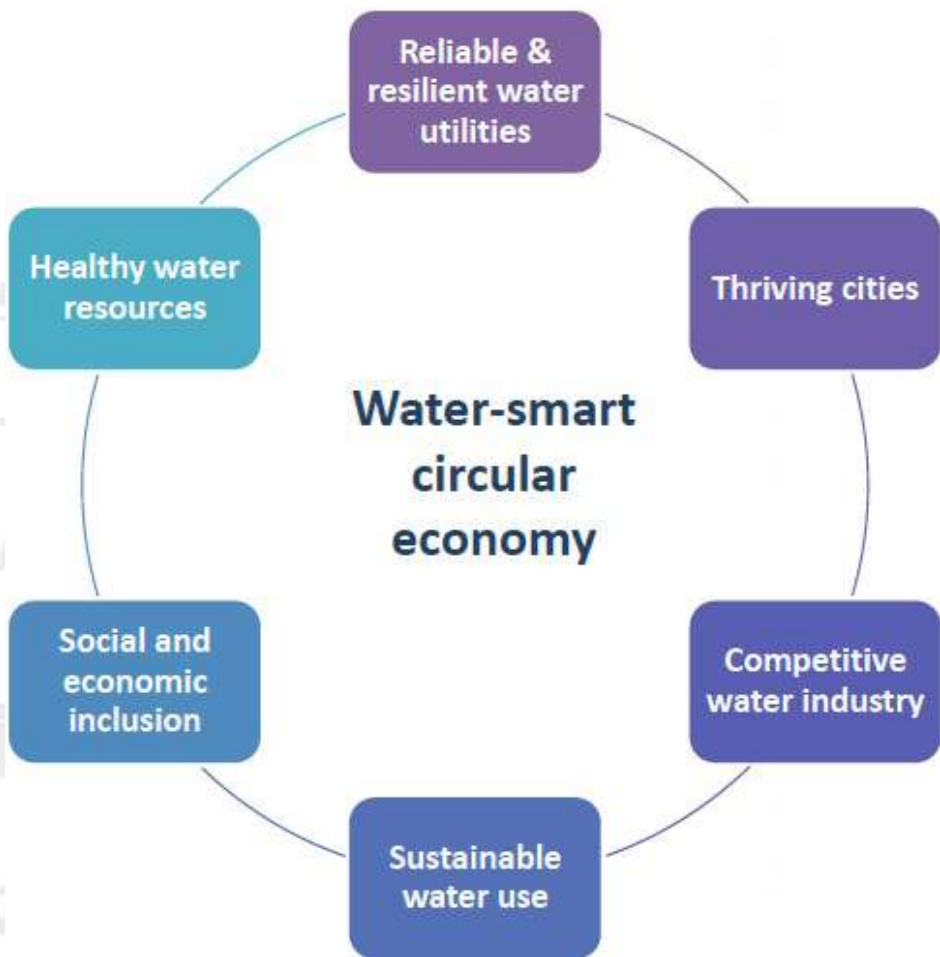

Urban biodiversity have direct effects on life quality and wellbeing (and health).

Having **access to the green space is generally beneficial for health**. Exposure to nature is linked to:

Low mortality (Donovan et al., 2013, Gascon et al., 2016, and others)

Better physical and mental health (Gascon et al., 2015; Triguero-Mas et al., 2015)

The opportunities to mainstream NBS in DEVELOPING COUNTRIES

Natural treatment technologies have high potential for application in developing countries, particularly by small rural communities.

Big experience in Participatory Community approach in many countries, especially from local public administrations (Medellin case, on social urbanism).

Multiagency involvement, including local stakeholders, public administrations, international cooperation agencies and climate action funding agencies. **Innovative big national projects to improve conditions in rural areas**, like Produtor de Aguas from ANA in Brazil or AQUARISC in Colombia.

Improving shared technical and scientific knowledge for implementing and managing NBS in cities (different LAC networks, 5 editions of Panamerican Conference on Wetland Treatment Systems, April 28-30 2021)

Traditional/Ancestral Ecological Knowledge and practices in Mexico, Perú, Colombia (Zenu nexus approach), Brazil...

Colaboran:

Nature-based solutions for Urban Resilience in the Anthropocene

The **NATURA** project links 26 networks in Africa, Asia-Pacific, Europe, North and Latin America

WWW.NATURA-NET.ORG

Cities and urbanized regions worldwide are exposed to extreme weather events and rising seas. They are at risk because their infrastructure often is in disrepair, no longer appropriate for more intense or frequent extreme events, or unable to keep up with rapid urban population growth. Traditional engineered infrastructure, such as stormwater drainage systems or sea walls, is usually designed for only one purpose and seldom can adapt to changing conditions. Solutions that are based on nature—preserving protective ecosystems, incorporating ecological elements or even mimicking nature in built infrastructure, offer flexibility in the face of changing conditions and provide multiple benefits to society, often at relatively low cost.

As an important part of knowledge sharing, researchers and practitioners will work together on applications of nature-based solutions (NBS) in a wide range of social, ecological, and technological contexts addressing five gaps:

- Synergistic benefits of bundles of NBS for urban resilience
- Role of social-cultural (S) context in NBS outcomes
- Role of ecological-biophysical (E) context in NBS outcomes
- Role of technological-infrastructure (T) context in NBS outcomes
- Role of SET interactions in NBS outcomes

The Nature-based solutions for Urban Resilience in the Anthropocene (NATURA) project links 26 networks in Africa, Asia-Pacific, Europe, North and Latin America, and globally to enhance connectivity among the world's scholars and practitioners and improve the prospects for global urban sustainability.

NATURA exchanges knowledge, shares data, and enhances communication among research disciplines and across the research-practice divide to advance urban resilience in face of growing threats of extreme weather events.

Through all-hands meetings, thematic working groups, regional nodes, and synthesis writing workshops, NATURA will accomplish the goals of synthesis and data sharing, and network coordination. Early-career researchers and practitioners will be sponsored by NATURA to pay five-week visits to network partners. Further, NATURA will train postdoctoral scholars and graduate students through learning exchanges to networks around the globe. Through collaboration with partners, international students will be invited to participate in these exchanges, hosted by US networks.
