

A Fragile Watermarking Approach for Earth Observation Data Integrity Protection

Maikel Lazaro Pérez Gort

Outline

- Motivation
 - EO Data Capabilities
 - Access and deployment
- Proposal
 - Watermark Synchronization
 - Fragile and Robust Watermarking
 - Proposed Architecture
- Experimental Validation
 - EO Data Applications
 - Tampering Detection
- Conclusions

Motivation

EO Data Capabilities

EO Data capabilities

Space

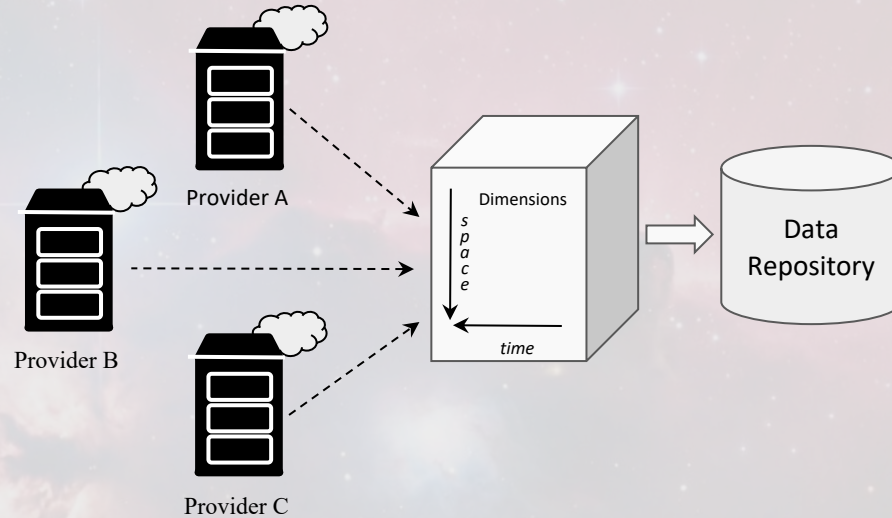

Time

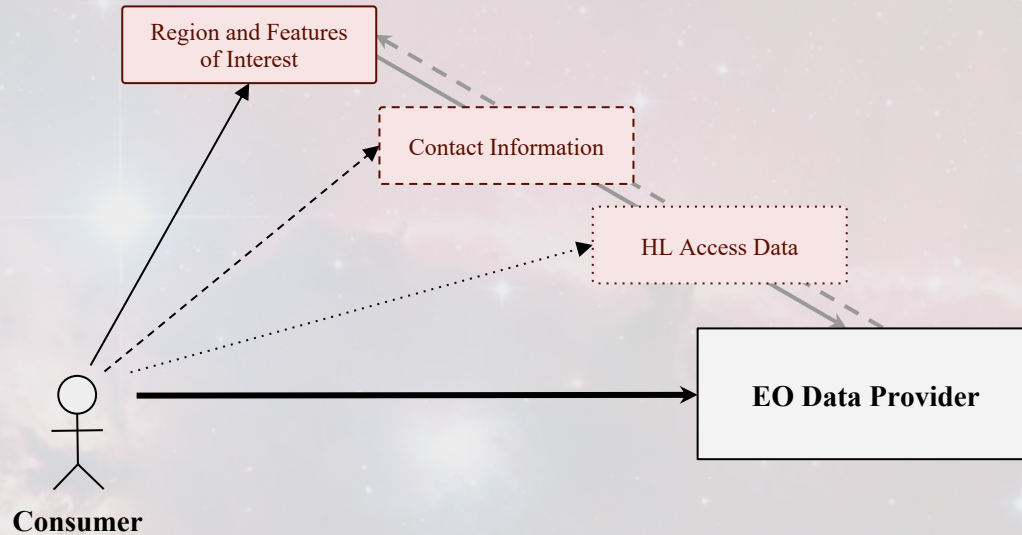

Possibility of express the same information through (and in) different data types

EO Data capabilities

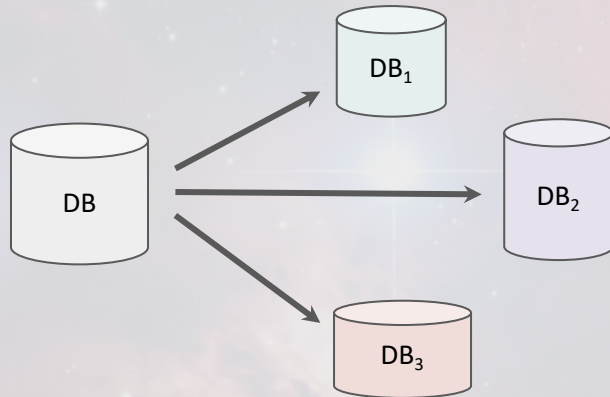

Access and deployment of EO Data

Risks faced by EO Data

Unauthorized Distribution

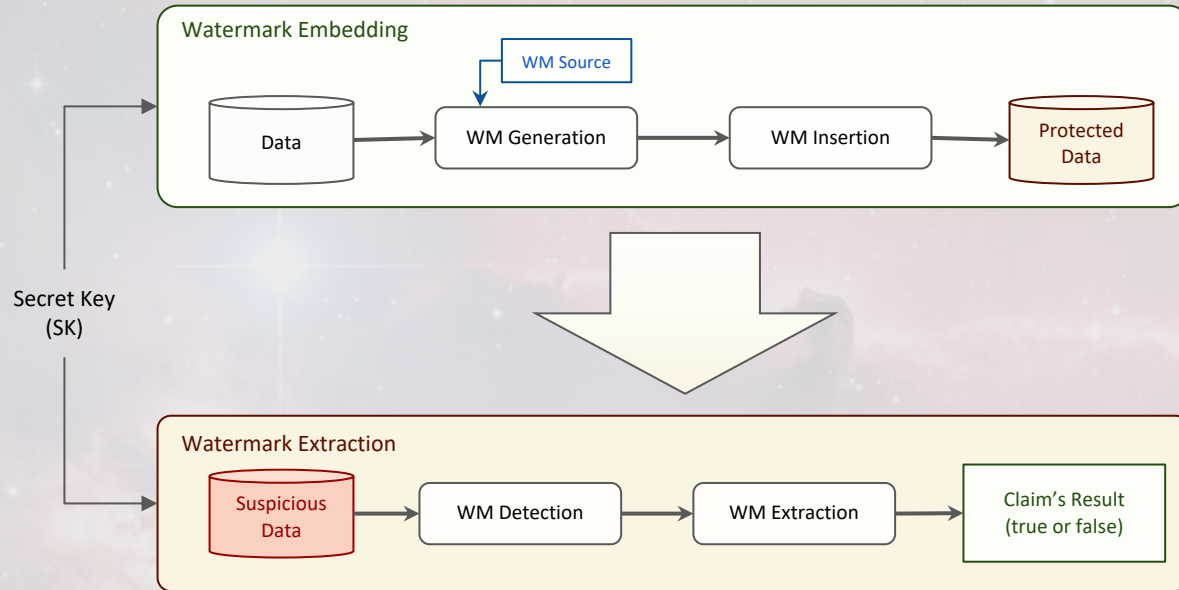

Data Tampering

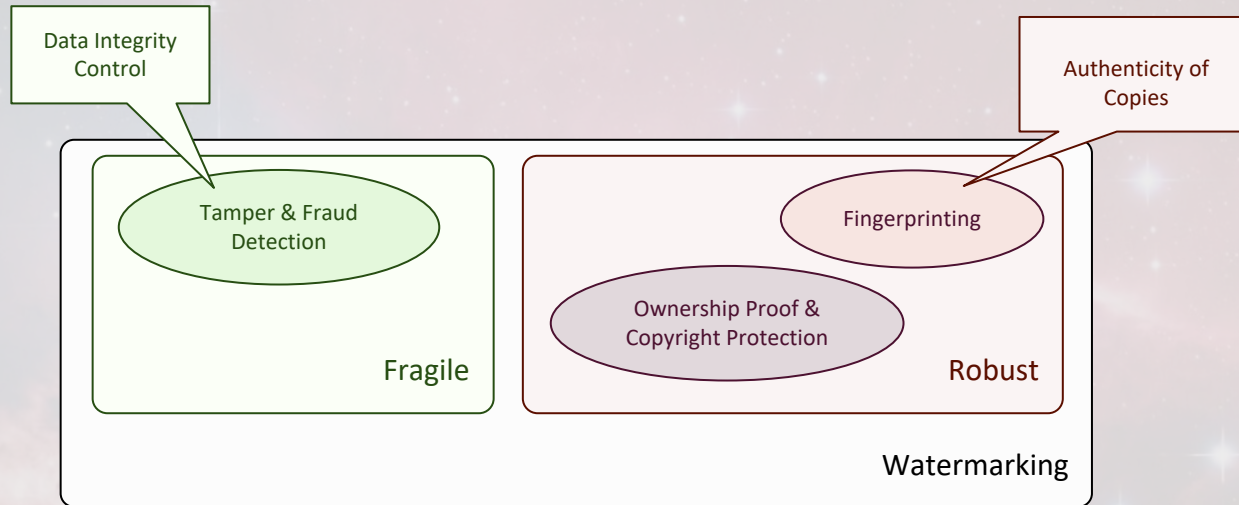

Proposed Approach

Digital Watermarking

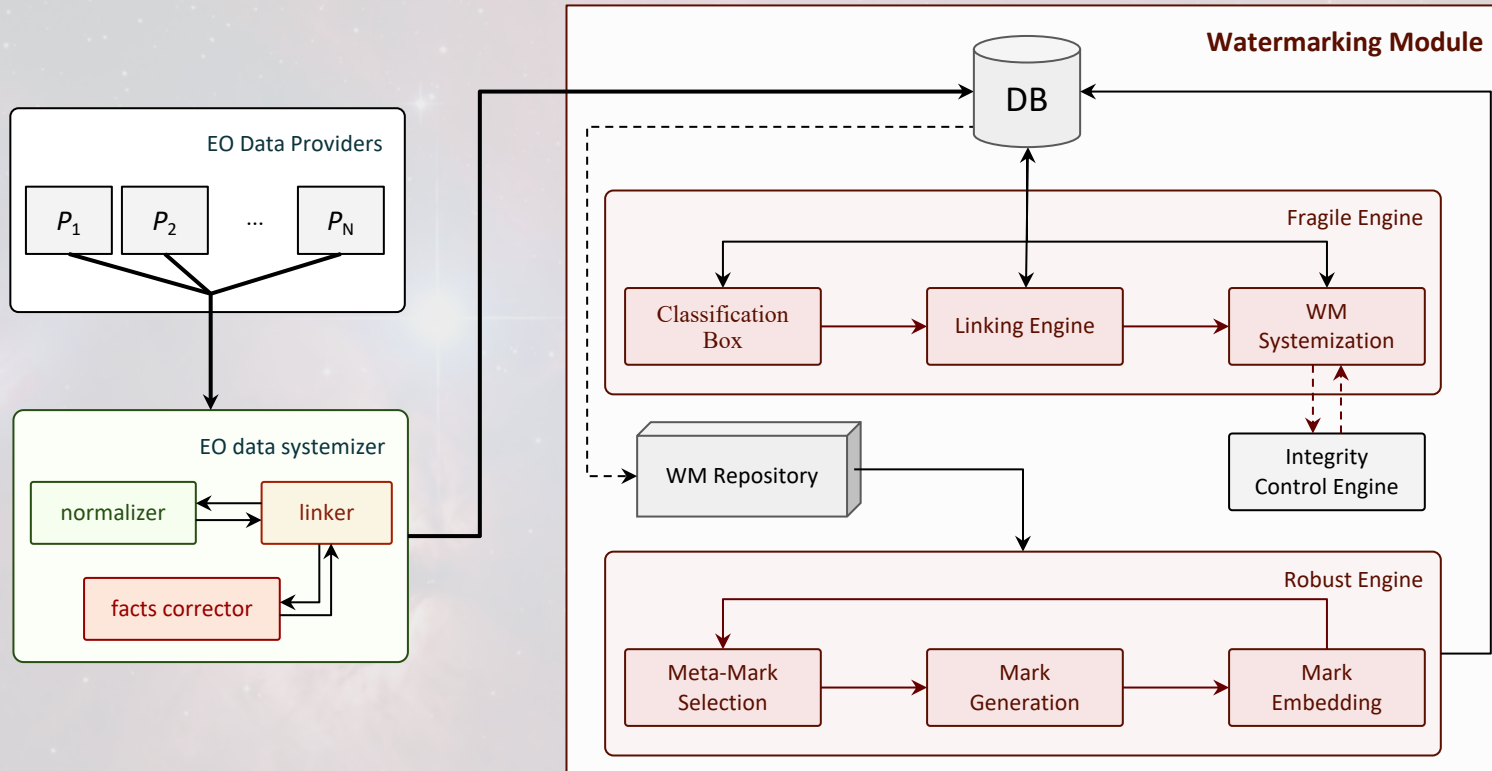

Watermark Synchronization

Fragile & Robust Watermarking

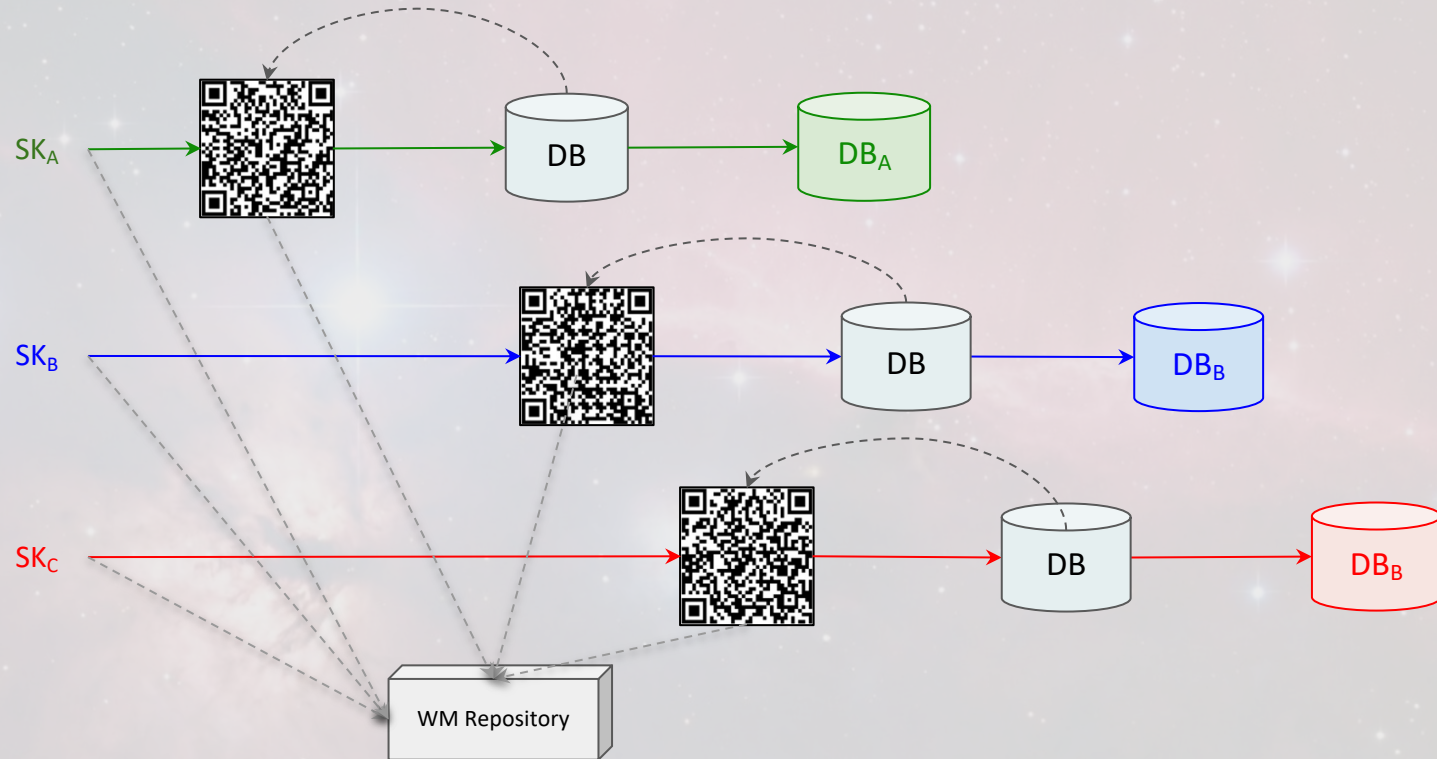

EO-DIPRE Architecture

Experimental Validation

Tests & Results

Authenticity of Copies

Reduction of Distortion

Land cover classification variations

Original

Watermarked

Tampering Detection

Data

- 1186500 records
- 11 columns

$n = 37$

$lsb = 1$

$msb = 4$

$tolerance \leq 10\%$

Despite the lack of visual clues

$n = 37$

$lsb > 1$

$msb = 4$

$changes > 10\%$

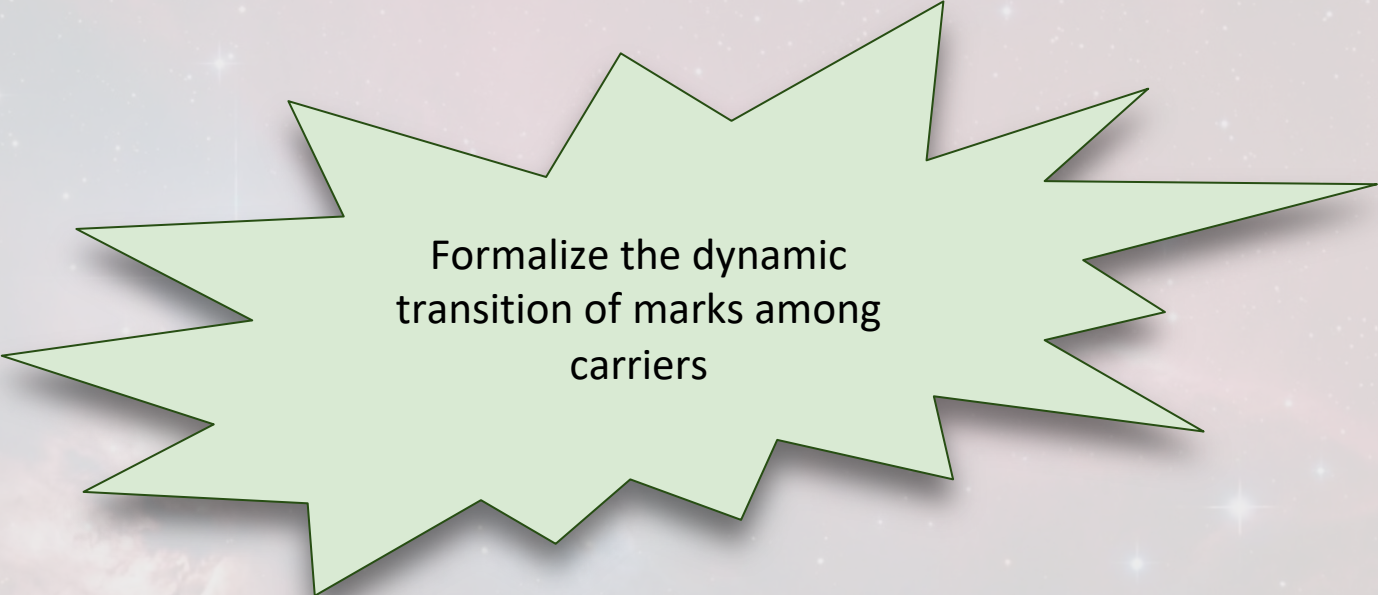

Conclusions

Closing Arguments & Future Work

Contributions

- Extenze cover for digital watermarking (fragile and robust)
 - Dimensions vs. facts (multiple facts)
 - Additional metrics for imperceptibility perception
- Variable Selection of components involved
 - Multiple-layers for tampering detection
 - Calibration of carriers
- Dynamic generation of WM sources

Future Work

Formalize the dynamic
transition of marks among
carriers

A Fragile Watermarking Approach for Earth Observation Data Integrity Protection
